Do energy storage systems provide ancillary services? However, the intermittent nature of renewable energy requires the support of energy storage systems (ESS) to provide ancillary services and save excess energy for use at a later time. ESS policies have been proposed in some countries to support the renewable energy integration and grid stability. What are energy storage policies? These policies are mostly concentrated around battery storage system, which is considered to be the fastest growing energy storage technology due to its efficiency, flexibility and rapidly decreasing cost. ESS policies are primarily found in regions with highly developed economies, that have advanced knowledge and expertise in the sector. Why do we need energy storage systems? The need to reduce greenhouse gas emissions has catalysed the rapid growth of renewable energy worldwide. However, the intermittent nature of renewable energy requires the support of energy storage systems (ESS) to provide ancillary services and save excess energy for use at a later time. How do ESS policies promote energy storage? ESS policies mostly promote energy storage by providing incentives, soft loans, targets and a level playing field. Nevertheless, a relatively small number of countries around the world have implemented the ESS policies. What is ESS / ancillary services / flexible operations? Storage for ancillary services/ balancing services / flexible operations: ESS with fast ramp rates can provide frequency control, voltage control, and fast response, peak shifting, balancing and ancillary services over time horizons ranging from seconds to minutes.

4.6. Who can use energy storage systems? Lease and sale of ESS: Licensees, developers, owners, lessors, lessees, procurers, and intermediary procurers can all make use of ESS. Developers or owners of ESS have the option to sell or lease storage capacity for a specific period.
