How is operations quality determined in PV plant operations? In the field of PV plant operations, operations quality is determined by (1) the ratio of the amount of energy harvested to the potential amount of energy available for a particular plant and (2) plant equipment availability over time. Why should you track energy availability in a PV operation contract? Tracking this availability (or unavailability) provides transparency into the equipment reliability state to all parties involved in an O& M services contract. In most PV operation contracts, energy will be the driving factor of whether the system is operating as expected. Why is energy availability important in assessing PV systems? Both energy and availability are necessary metrics for assessing PV systems. If the stakeholders involved in a contract are most interested in energy production, and if the contract holds parties responsible for energy production, then it is crucial that energy losses associated with unavailability and system performance are accounted for. How much of a PV module can be recycled? Demonstration projects at SolarWorld and commercial-scale recycling operations at First Solar have shown that 84% to 90% by weight of a PV module can be recycled (Larsen). If a system transfers ownership, it is important to consider how warranties are handled. How does energy affect a PV operation contract? In most PV operation contracts, energy will be the driving factor of whether the system is operating as expected. EPC guarantees, operator guarantees, owner measure of ROI, and other considerations for a contract are mostly based on whether the system produced energy as it was expected to. How do I manage a fleet of PV systems? Operating and maintaining a fleet of PV systems requires active resource management and data acquisition and analysis by the asset and operation manager(s). Outsource the service to a specialized third-party O& M provider.
