Does a grid-level battery energy storage system perform energy arbitrage? The present work proposes a long-term techno-economic profitability analysis considering the net profit stream of a grid-level battery energy storage system (BESS) performing energy arbitrage as a grid service. What is a battery energy storage system? Battery energy storage systems (BESS) are rechargeable batteries that can store energy from different sources and discharge it when required. BESS consists of one or more batteries that can balance the electric grid, deliver backup power, and enhance grid stability. What is the market share of battery energy storage systems in ? By connection type, on-grid installations held a 78% share of the battery energy storage system market in ; off-grid applications are the fastest-growing segment at 18.5% CAGR. By component, battery packs, and racks represented 63% revenue share in ; energy-management software is advancing the fastest, at 20% CAGR. How profitable is Bess for Energy Arbitrage grid applications? In fact, as reported by the CAISO special report on battery storage , the largest positive revenue comes from day-ahead market energy schedules. For this reason, it is crucial to properly analyze the profitability of using BESS for energy arbitrage grid applications. What percentage of battery capacity is used for price arbitrage? Considering the U.S. wholesale electricity markets, >80 % of the battery capacity added in in the CAISO service territory was used for price arbitrage. In fact, as reported by the CAISO special report on battery storage , the largest positive revenue comes from day-ahead market energy schedules. Are energy arbitrage profits overestimated? However, it is worth noting that previous research on energy arbitrage profits from the PJM market [26, 27] suggests that the perfect foresight assumption may lead to overestimation of arbitrage revenue, but by a modest percentage (10-15 %) when compared to simpler strategies that rely on back casting of recent historical prices.
