What is Lift Energy Storage Technology (LEST)?Lift Energy Storage Technology (LEST) is a gravitational-based storage solution. It stores energy by lifting wet sand containers or other high-density materials using autonomous trailer devices. The system requires empty spaces on the top and bottom of the building. Can lifts be used as energy storage devices?There are several ghost towns where the lifts could be used as energy storage devices through Lift Energy Storage Technology (LEST). A review of ghost cities in China can be seen in Ref. . In some cases, the investors do not rent empty apartments because they want to be flexible to sell the flat any time they get a good price. Could lift energy storage technology be a viable alternative to long-term energy storage?Conclusion Lift Energy Storage Technology (LEST) could be a viable alternative to long-term energy storage in high-rise buildings. LEST could be designed to store energy for long-term time scales (a week) to generate a small but constant amount of energy for a long time. What is the proposed arrangement for the lift energy storage system?An example of the proposed arrangement is presented in Table 1. Energy is stored as potential energy by elevating storage containers with an existing lift in the building from the lower storage site to the upper storage site. Electricity is then generated by lowering the storage containers from the upper to the lower storage site. What is LEST Lift and how does it work?LEST (Lift Energy Storage Technology) is an EES (Electrical Energy Storage) technology that uses an existing lift in a high-rise building to store energy. In the charging mode, the lift elevates a solid mass to the top of the building, and in the discharge mode, it lowers the mass to generate electricity. Lift technology is very mature and has been applied widely everywhere. How long does a lift system last?The technical lifetime of a lift energy storage system can vary from 20 to 30 years. The power generation will depend on the existing numbers of lifts in the considered buildings. The higher the height difference between the lower and upper storage sites, the lower the project's cost.
