The U.S. Department of Energy (DOE) awarded Case Western Reserve University \$10.75 million over four years to establish a research center to explore Breakthrough Electrolytes for Energy Storage (BEES), with the intent of identifying new battery chemistries with the potential to provide large, long-lasting energy. We effectively combine fundamental electrochemical engineering expertise with advanced materials research in an environment that includes the world-renowned Building upon 80 years as a top electrochemistry university, Case Western Reserve University and its faculty are applying their expertise to chemical energy storage and the development of new and better batteries. Breakthrough Electrolytes for Energy Storage and Systems Mission Statement: To uncover the transport mechanisms of ions, protons, redox species, and electrons in nano to meso scale structured electrolytes in the bulk and at the electrode. Research at Case Western Reserve focuses on building better. Currently, some are water-based and limited in how much energy they can store, while others are chemical solvent-based that can hold more energy but are also more. Breakthrough Electrolytes for Energy Storage Energy Frontier The BEES DOE EFRC focuses on fundamental understanding of new battery electrolytes with the potential to provide large-scale, long-lasting energy storage solutions for \$12 million boost for energy storage research center. Growth in solar power and other renewable energy sources has been slowed some by a lack of storage capacity, but researchers at Case Western Reserve University are exploring new large.
